Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
- H User selected alternate compound hit
- $\ensuremath{\mathrm{M}}$  Peak manually integrated or manually identified
- R Peak fails recovery
- U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

0163

a - Peak quantitates below reporting limit

H - User selected alternate compound hit

M - Peak manually integrated or manually identified R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

#### FORM 1 OTHER ORGANICS ANALYSIS DATA SHEET

ENVNET SAMPLE NO.

F01009LS63

Lab Name: STL BURLINGTON

Contract: 22000

Lab Code: STLVT Case No.: 22000 SAS No.:

SDG No.: 89891

Matrix: (soil/water) SOIL

Lab Sample ID: 502119

Sample wt/vol:

30.1 (g/mL) G

Lab File ID: 030CT021608-R221

% Moisture: 24

decanted: (Y/N) N

Date Received: 09/25/02

Extraction: (SepF/Cont/Sonc) SOXH

Date Extracted: 09/26/02

Concentrated Extract Volume: 10 (mL)

Date Analyzed: 10/04/02

Injection Volume: 1.0(uL)

Dilution Factor: 1.0

GPC Cleanup: (Y/N) N

pH:

Sulfur Cleanup: (Y/N) Y

CONCENTRATION UNITS:

(ug/L or ug/Kg) UG/KG

Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
- H User selected alternate compound hit
- M Peak manually integrated or manually identified
- R Peak fails recovery
- ${\tt U}$  User disabled peak  ${\tt ID}:$  either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

0172

Reported: 10/17/2002 09:57 rrm 03oct021608-r221.d Page 2

a - Peak quantitates below reporting limit

H - User selected alternate compound hit

M - Peak manually integrated or manually identified

R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

a - Peak quantitates below reporting limitH - User selected alternate compound hit

 $\ensuremath{\mathrm{M}}$  - Peak manually integrated or manually identified

R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

a - Peak quantitates below reporting limit

H - User selected alternate compound hit
M - Peak manually integrated or manually identified

R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or

peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

a - Peak quantitates below reporting limitH - User selected alternate compound hit

M - Peak manually integrated or manually identified

R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

a - Peak quantitates below reporting limit

H - User selected alternate compound hit
M - Peak manually integrated or manually identified

R - Peak fails recovery

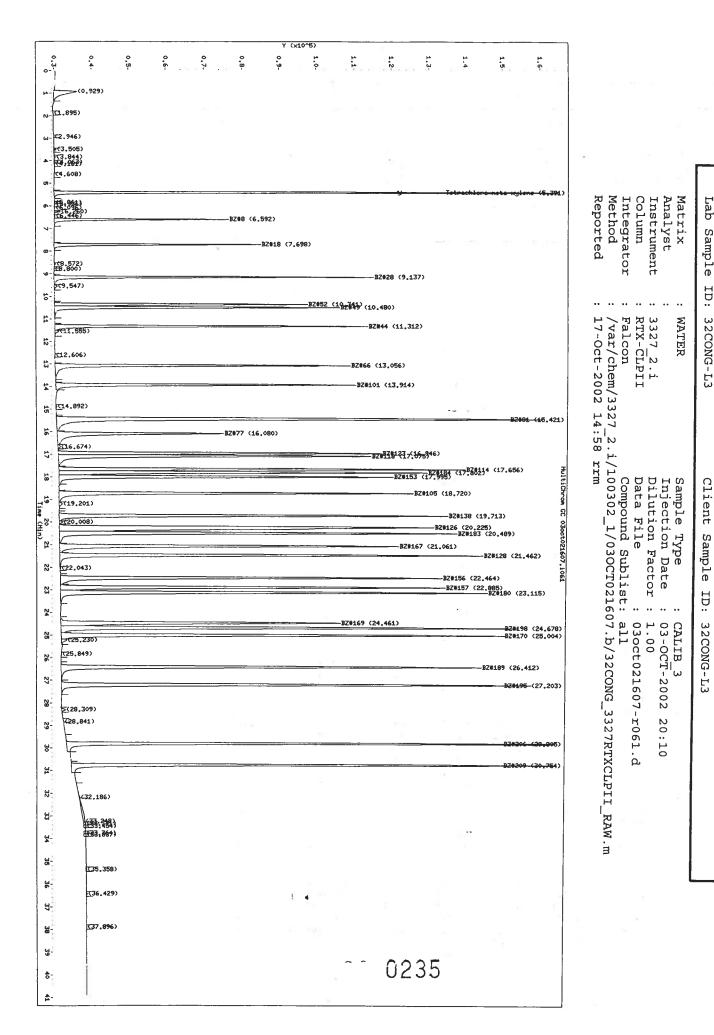

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

a - Peak quantitates below reporting limit

H - User selected alternate compound hit

 $\ensuremath{\mathrm{M}}$  - Peak manually integrated or manually identified

R - Peak fails recovery

 ${\tt U}$  - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
- H User selected alternate compound hit
- M Peak manually integrated or manually identified
- R Peak fails recovery
- U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range a - Peak quantitates below reporting limit

- H User selected alternate compound hit
- M Peak manually integrated or manually identified
- R Peak fails recovery
- U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

#### Target Compounds

Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
- H User selected alternate compound hit
- M Peak manually integrated or manually identified
- R Peak fails recovery
- U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range a - Peak quantitates below reporting limit

H - User selected alternate compound hit

M - Peak manually integrated or manually identified

R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

The state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the s

## STL Burlington - Target GC Injection Report

Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
- H User selected alternate compound hit
- $\ensuremath{\mathrm{M}}$  Peak manually integrated or manually identified
- R Peak fails recovery
  U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

a - Peak quantitates below reporting limit

H - User selected alternate compound hit

M - Peak manually integrated or manually identified

R - Peak fails recovery

 ${\tt U}$  - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
- H User selected alternate compound hit
- M Peak manually integrated or manually identified
- R Peak fails recovery
- U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

Flags: A - Peak quantitates above calibration range

- a Peak quantitates below reporting limit
  H User selected alternate compound hit
- M Peak manually integrated or manually identified
- R Peak fails recovery
- U User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

H - User selected alternate compound hit

 $<sup>\</sup>ensuremath{\mathrm{M}}$  - Peak manually integrated or manually identified

R - Peak fails recovery

U - User disabled peak ID: either peak quantitates below reporting limit or peak identification not confirmed on second column

# STL Burlington - Target GC Injection Report

C.3 Historical Assessment of the Lagoon from Aerial Photographs

## APPENDIX C.3

# HISTORICAL ASSESSMENT OF THE LAGOON FROM AERIAL PHOTOGRAPHS

A historical assessment of the lagoon environment was completed simultaneously with the historical assessment of the land area. A detailed description and visual analysis of the aerial photographs are included in Section 2.5 of the Ecosystem Restoration Report (ERR). The Commonwealth of the Northern Mariana Islands (CNMI) Division of Environmental Quality (DEQ) marine biology staff members were instrumental in the interpretation of changes in the lagoon environment apparent in the aerial photographs. The aerial photographs are included in Appendix C of the ERR.

## INTERPRETATION OF LAGOON ENVIRONMENT CHANGES

Upon review of the aerial photographs, it is apparent that the lagoon environment reacts to terrestrial changes on the adjacent shore. The nearshore *Enhalus* band is characteristically located in an area of freshwater infiltration and has remained fairly consistent throughout the past 70 years. The most significant changes have occurred in the mid-lagoon region, where *Halodule* and macroalgae are dominant. During periods when there was heavy development/land devoid of vegetation within the study area (1944, 1945, and 1999), abundant *Halodule* and macroalgae are apparent in the lagoon. During periods when development was suppressed due to minimal population and terrestrial vegetation was heavy, the lagoon appears to have more sandy-bottom areas and less macroalgae cover.

As discussed earlier, the 1945 image shows that Japanese development of the time was heavy. There are regions of exposed dirt/dredge material, many buildings, and numerous dirt "coral capped" roads throughout the region. This development and high population of the time were most likely associated with septic systems or other types of sewage disposal. Waste from these sources containing high levels of nutrients washing into the lagoon system affects the marine communities by supporting macroalgae and seagrass community growth (see Section 3.1.2.1 of the ERR). The 1945 photograph shows a band of what is most likely *Enhalus* seagrass closest to shore. This black band extends out to the deeper mid-lagoon region. The assumption is made that the *Enhalus* seagrass region, similar to all other photographs, extends only a couple hundred meters off-shore. The remaining portion of the black band in the 1945 image is probably Halodule seagrass or macroalgae stands. There is another bed of Halodule seagrass or macroalgae in the outer lagoon near the lighthouse. This is significant because the deeper midlagoon region is associated with stronger currents and tidal exchanges. These events would theoretically exchange high nutrient lagoon waters before they reach the outer lagoon. The large stand of seagrass or macroalgae present in the 1945 image suggests that nutrient rich groundwater may be affecting communities of the outer lagoon in the study area.

This high level of seagrass and macroalgae development is absent in later images from 1956, 1969, and 1976. All of these images show a band of *Enhalus* seagrass of varying width close to shore. None of the images show seagrass and macroalgae growth extending from shore to the mid-lagoon region. Furthermore, none of these images show any large development of seagrass or macroalgae in the outer lagoon. The majority of the lagoon as seen in the photographs shows

a barren sandy bottom, which requires lower levels of nutrients in runoff water, and groundwater, to maintain. Urban development and population levels had decreased during this time frame, with areas of former soil exposure replaced with vegetation growth, lessening nutrient transport to the lagoon.

The most recent (2009) image shows the most resemblance to the 1945 image in terms of seagrass and macroalgae stands associated with heavy urbanization and development within the watershed. Furthermore, it is only in the 1945 and 2009 image where there is a *Halodule* and macroalgae stand development in the outer lagoon, near the lighthouse. Thus the assumption can be made that increased development within the region during both the Japanese era and recent years have led the area susceptible to erosion and increased surface runoff, leading to an increase in contaminants, nutrients, and sediment washing into the lagoon, and ultimately altering the marine system.

C.4
Inshore Lagoon Seagrass and Associated Fauna Survey

## APPENDIX C.4

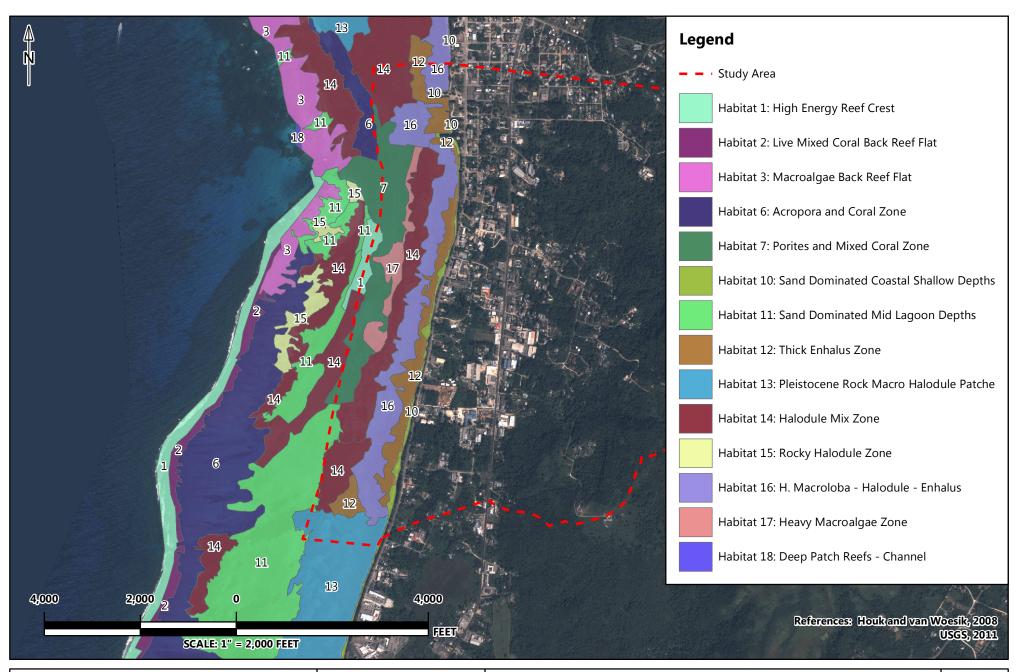

## INSHORE LAGOON SEAGRASS AND ASSOCIATED FAUNA SURVEY

The MMT Saipan Lagoon monitoring effort has completed an inventory of the lagoon, including the study area. Results of the initial assessment efforts in the study area indicate that the inner lagoon habitats are affected by increased nutrients associated with stormwater from the West Takpochau watershed reaching the drainages and shores in this region, and entering the lagoon. These habitats have high abundances of seasonal macroalgae growth when compared to outer lagoon habitats.

The MMT has designated 18 habitat classifications within the lagoon (Figure C.3). The focus of this study are the inshore habitats (Habitats 10, 12, 14, and 16) since they receive the majority of the fresh water pollution and serve as the first line of defense for the valuable coral reef and fisheries resources that lay further offshore.

- Habitat 1: Consists of a hard bottom with encrusting coralline algae and encrusting coral, along with turf algae. The typical depth of this habitat is approximately 0 to 2 feet.
- Habitat 2: Consists of a sandy bottom with a scattered abundance of live corals. The most common living benthic organism within this habitat is turf algae. The depth of this habitat is very shallow at approximately 1 to 3 feet.
- Habitat 3: Consists of a hard bottom with scattered sandy patches and seasonal macroalgae. The typical depth of this habitat is approximately 1 to 3 feet.
- Habitat 6: Consists of a sandy bottom with staghorn corals, *Acropora spp.*, in high abundances. Turf algae are also abundant. The typical depth of this habitat is approximately 5 to 7 feet. The framework resulting from accretion of the branching staghorn coral skeletons provides refuge for fish and other invertebrates. As a result, this habitat is heavily fished on a daily basis.
- Habitat 7: Consists of a sandy bottom with sparse living and dead corals. This habitat is in the deeper lagoon waters at approximately 10 to 12 feet. Dead corals generally have either turf algae or coralline algae growing on their surfaces.
- Habitat 10: Consists of a barren sand zone adjacent to shore. The common black sea cucumber, *Holothuria atra*, is abundant, and unattached seasonal macroalgae can be present dependant on local weather and oceanographic conditions. The typical depth of this habitat is approximately 1 to 2 feet.
- Habitat 11: Consists of a sandy bottom with the small seagrass, *Halodule uninervis*, and the very tiny seagrass, *Halophila minor*. This habitat is in the deeper lagoon waters at approximately 10 to 12 feet. Abundance of the common black sea cucumber, *Holothuria atra*, is highest in this habitat, possibly due to the predominantly sandy bottom.

- Habitat 12: Consists of the large seagrass, *Enhalus acoroides*. The typical depth of this habitat is approximately 2 to 4 feet. There are 81.8 (plus or minus  $[\pm]$  17.1) roots per 0.25 square meter  $(m^2)$  in this habitat.
- Habitat 13: Consists of a sandy bottom with the macroalgae, *Gelidiella acerosa* and turf algae. The average depth of this habitat is approximately 2 to 4 feet.
- Habitat 14: Consists of the small seagrass, *Halodule uninervis*, and the macroalgae, *Halimeda opuntia* commonly occurring along with other seasonal macroalgae. The typical depth of this habitat is approximately 3 to 5 feet.
- Habitat 15: Consists of a sandy bottom with abundant small seagrass, *Halodule uninervis*. The typical depth of this habitat is approximately 3 to 5 feet. Live and dead coral rocks are randomly located throughout this habitat, with less than 2 percent benthic coverage. This habitat is located adjacent to one or more barrier reef habitats.
- Habitat 16: Consists of a sandy bottom with the large seagrass, *Enhalus acoroides*, intermixed with the smaller seagrass, *Halodule uninervis*. There is also a large abundance of seasonal macroalgae in this habitat. The typical depth is approximately 3 to 5 feet.
- Habitat 17: This habitat is only located adjacent to the lighthouse channel and has not been found in any other Saipan Lagoon location. This habitat consists of a sandy bottom with a high abundance of seasonal macroalgae. The typical depth of this habitat is approximately 2 to 4 feet.
- Habitat 18: This is a habitat unique to the deeper areas of the lighthouse channel in the study area. The habitat is dominated by a sandy bottom with patch reefs at depths of approximately 12 to 20 ft.

C.5
Inventory of Potentially Contaminating Activities in Watershed

## APPENDIX C.5

# INVENTORY OF POTENTIALLY CONTAMINATING ACTIVITIES IN WATERSHED

An integral part of this aquatic ecosystem restoration study was to identify land-based sources of pollution that could potentially contribute nutrients, sediments, or contaminants to the lagoon. Potentially contaminating activities (PCAs) within the study area were inventoried and subjected to a susceptibility analysis.

#### **METHODOLOGY**

Protocol for conducting the PCA inventory was based on guidelines included in the Source Water Assessment Program (SWAP) that was part of the Safe Drinking Water Act amendment in 1996. The objective of the SWAP program was to assess the susceptibility of all drinking water sources to activities that have significant potential to release contaminants to water sources. Although drinking water is not the primary focus of this study, the same principles were applied during the assessment of PCAs that affect the lagoon water. Therefore, for this study, a PCA is defined as a facility or activity that 1) stores, transmits, uses, or produces contaminants, chemicals or by-products; and 2) has the potential to release contaminants that may impact the quality of the lagoon water. The purpose of the inventory was to identify and locate all significant PCAs that are situated within the study area.

#### TECHNICAL APPROACH

The three basic steps of a PCA inventory are as follows:

- 1. **delineation** of the assessment area around the water source;
- 2. **inventory** of the assessment area to identify PCAs; and
- 3. **susceptibility** of the lagoon water to become contaminated from the identified PCAs.

#### **Delineation**

The purpose of delineating the assessment area is to determine the area around the lagoon that has a direct influence on the water quality of the lagoon. The area of concern for this study consists of the entire watershed within the study area, stretching from the shoreline to the west, the ridgeline to the east, Garapan Fishing dock to the north, and Quartermaster Road to the south.

## Inventory

Prior to conducting an inventory within the delineated assessment area, a list of PCAs was developed and each PCA was assigned to one of four categories: very high, high, medium and low potential to contaminate the lagoon. The PCA category list is presented in Table C.8.

PCAs were identified during a survey of the study area that was aided by a review of aerial photographs and maps of the study area. A field investigation was conducted to verify the existence, location, and nature of the PCAs identified during the data search described above.

# Susceptibility Analysis

Each individual PCA was categorized according to its class of contaminant. Four classes of contaminants were identified:

- 1. Sedimentation Any site or activity that could contribute unnaturally high sediment loads to the lagoon.
- 2. Hazardous Constituents Any site or activity that could contribute hazardous materials, chemicals, and/or waste to the lagoon.
- 3. Nutrient Sources Any site or activity that could contribute nutrient-laden materials to the lagoon.
- 4. Runoff Any site that is covered with a significant impervious surface (i.e. pavement) that produces unnaturally high freshwater runoff during storm events.

The health of the lagoon aquatic ecosystem is potentially adversely affected by all four of these contaminant types (hazardous, sediment, nutrient, and runoff). These contaminant classes are interrelated in that all are transported to the lagoon via stormwater runoff. Certain features within the watershed facilitate runoff (paved surfaces), certain activities contribute sediment and nutrients (de-vegetated land, agricultural land, malfunctioning sewage systems), and certain activities contribute hazardous contaminants (auto repair shops, surface spills, and light industrial facilities). Based on the high percentage of de-vegetated land area within the study area, contaminants such as nitrates, phosphates, and other nutrients found in soil and sediment are of the most concern because of their susceptibility to be transported to the lagoon via stormwater runoff. As discussed previously, elevated nutrient levels entering the lagoon have a deleterious effect on various components of the ecosystem and on the general function of the ecosystem as a whole.

#### GENERAL LAND USE ANALYSIS

The study area is characterized by a highly urbanized band located between Beach Road and Middle Road. Development in this area consists of garment factories, light industrial buildings, and residences. The Gualo Rai residential area lies upslope and inland of Middle Road. Many of the small side roads and lots are unpaved. There are storm drains along Middle Road and Beach Road, but there is no comprehensive collection and conveyance system designed to control stormwater within the developed areas in the Gualo Rai district and between Middle and Beach Roads. The storm drains that are present are poorly maintained and culverts are often clogged with sediment and debris.

De-vegetated, unpaved, and exposed soil surfaces, and impervious paved surfaces, coupled with the absence of a stormwater collection system leads to increased sediment loads entering the lagoon during storm events. During a storm event, roadways and paved lots serve as surface flow channels for rainwater runoff, enabling the transport of

# **Table C.8: PCA Category List**

The potential for contamination is based on the nature of the activities, contaminants associated with those activities, and past record of groundwater and/or surface water contamination regardless of whether any environmental standards were exceeded. The potential for contamination does not reflect toxicity of the contaminant and should not be utilized as a means of assessing risk. These rankings do not take into account any site-specific practices such as pollution prevention or protection measures such as BMPs. PCAs utilizing BMPs that may mitigate potential contamination will be acknowledged in the assessment summary.

<sup>\*</sup>PCAs associated with microbial contamination.

sediment and surface contaminants to the lagoon. Large deposits of sediment create unnaturally large deltas in the lagoon, destroying the nearshore lagoon habitat. In addition, the sediment generally contains high levels of nutrients, such as nitrates and phosphates, which can have a deleterious effect on the lagoon water quality and ecosystem components in general. Stormwater runoff also transports surficial contaminants, such as spilled petroleum products from auto shops and parking lots, and microbiological contaminants from overflowing septic systems and sewer system leach fields, to the lagoon.

#### **DETAILED SITE INVENTORY**

Fifty four (54) sites were identified during the PCA inventory. A summary of the PCA inventory is provided in Table C.9 while detailed individual PCA information is presented in Table C.10. Figure C.4 depicts the location of each of the PCAs within the study area. The numbers presented in Table C.9 were used during the evaluation of the proposed detention basin sites (see Section 5.5of the ERR).

**Table C.9: PCA Summary** 

| Possible<br>Contaminant<br>Sources | Sedimentation | Hazardous | Nutrients | Runoff |
|------------------------------------|---------------|-----------|-----------|--------|
| Number of Sites                    | 6             | 32        | 2         | 26     |

Note: Some sites contained more than one possible contaminant source.

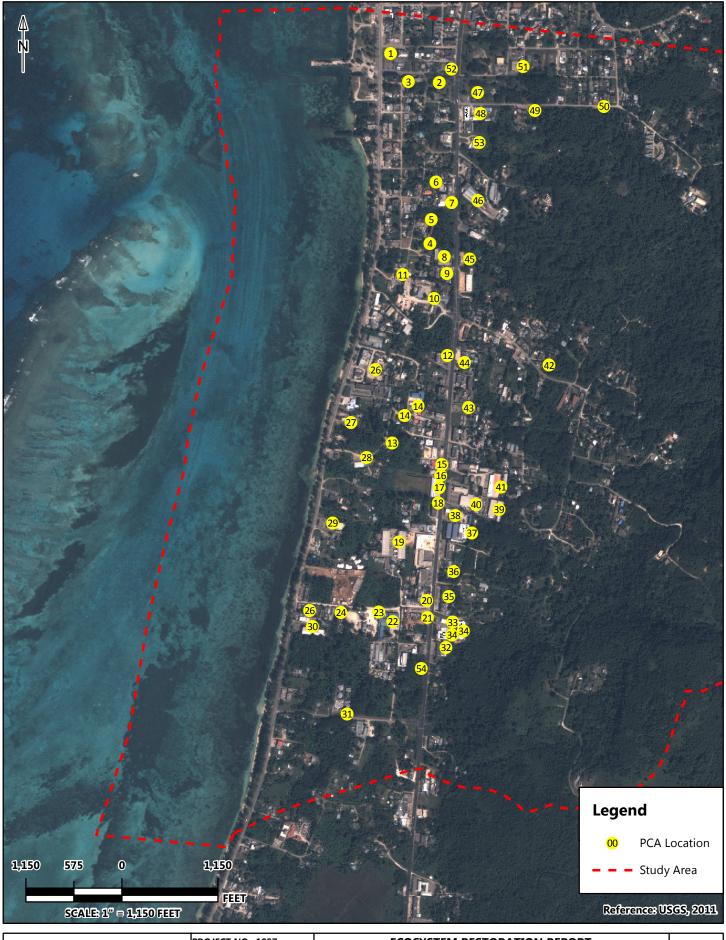

**Table C.10: Detailed PCA List** 

| PCA# | PCA Name                                            | PCA Description                                    | Contaminant Type<br>(Sed, Haz, Nut, Runoff) |
|------|-----------------------------------------------------|----------------------------------------------------|---------------------------------------------|
| 1    | Catholic Church Parking Lot                         | Parking lot with ~80 parking stalls                | Runoff                                      |

C.6 Groundwater Investigation

## **APPENDIX C.6**

## **GROUNDWATER INVESTIGATION**

Nearshore groundwater samples were collected along the entire length of the study area and beyond in March, June, and August, 2002, in an effort to determine the impact of on-shore surface contaminants on the lagoon via groundwater infiltration. Samples were collected at low tide by manually digging holes on the shoreline and collecting the groundwater infiltrating to the shoreline. Four rounds of samples were collected and field analyzed for nitrate/nitrite and phosphate as well as water quality parameters. Nitrate concentrations in groundwater infiltrating at the shoreline ranged from 0 to 2.61 milligrams per liter (mg/L) (Table C.11). The Commonwealth of the Northern Mariana Islands (CNMI) water quality standard for nitrates in Class AA marine waters is less than (<) 0.20 mg/L (DEQ, 2010). Although this standard does not apply to groundwater, it is useful to apply to the nearshore groundwater samples due to their adjacent proximity to lagoon waters.

Bold values exceed the CNMI water quality standard for Class AA Marine Waters.

The 2002 analytical results indicate that there are elevated nitrate levels in nearshore groundwater infiltrating to the lagoon. Nitrate levels of nearshore coastal marine waters may be affected by activities within the watershed.

Although semi-annual groundwater monitoring, including monitoring for nitrate indicators, has been required by the CNMI Division of Environmental Quality (DEQ) for many years, more recent groundwater data collected within the study area are not available due to the lack of a comprehensive groundwater management plan that includes methods for analyzing the collected samples and actions to be taken based on the data collected (DEQ, 2010).

C.7 Hydrologic Study of Runoff Processes in Watershed

## APPENDIX C.7

# HYDROLOGIC STUDY OF RUNOFF PROCESSES IN WATERSHED

## C.7.1 RAINFALL AND RUNOFF DATA COLLECTION

In order to acquire quantitative rainfall and runoff data, monitoring instruments were installed at several locations throughout the study area. Three tipping bucket rain gauges were installed on building rooftops, one on the Harabuchi Federal Building roof top at the northern end of the study area, one on the Pizza Hut Building roof top on Middle Road, and one on the Geotesting Building roof top at the southern end of the study area. These tipping bucket rain gauges recorded every 0.01 inch of rainfall on an automated recorder. Data was downloaded periodically during 2002.

Two pressure transducers were installed, one in a storm drain beneath Middle Road at the Quartermaster Road intersection and another in a storm drain beneath Middle Road, across from the Subway sandwich shop. These transducers measured and recorded the pressure and temperature of stormwater surface flow during rain events. For redundancy's sake, several stormwater events were measured manually throughout the year to augment the data collected by the transducers and rain gauges.

Data collected from the rain gauges, transducers, and by manual measurements was compiled in order to help determine general comprehensive hydrologic processes within the study area. Due to the logistical difficulties involved with collecting field data, the number of readings is limited. In an effort to compare data from the three monitoring efforts (rain gauges, transducers, and manual measurements), data from seven discrete rain events is compiled in Table C.12 through Table C.18.

Manual measurements of stormwater runoff were recorded most consistently from the intersection of Middle Road and Quartermaster Road. Based on average flow rates and duration of measurement intervals, discharge amounts were calculated ranging from 150 gallons over 12 minutes (on February 13, 2002) to 69,696 gallons over four hours and two minutes (September 20, 2002).

During the August 12, 2002 rain event, peak flow rates were measured at nine drains along Beach Road. Peak flow rates ranged from 12 gallons per minute (gpm) at Drain 13 to 1000 gpm at Drain 6. Table C.19 presents estimated stormwater runoff flow to the lagoon during this rain event.

Table C.12: Rain Event 1 (February 13, 2002)

During two rain events, field measurements of average and peak flow at the intersection of Quartermaster Road and Middle Road can be compared to the cumulative amount of rainfall recorded at the raingauge at the Geotesting Building. Within the 10-hour interval during the September 18-19, 2002 rain event, the raingauge at the Geotesting Building recorded 1.82 inches of cumulative rainfall (Table C.17). The peak and average runoff flow during the last 15 minutes of this rain interval were 200 gpm and 150 gpm, respectively. This translates to a stormwater runoff volume of 2,250 gallons over 15 minutes. If the average flow rate of 150 gpm was applied to half of the 10-hour interval, the resulting estimate would be 45,000 gallons over five hours.

During a nine-hour interval on September 20, 2002, the raingauge at the Geotesting Building recorded 2.68 inches of cumulative rainfall (Table C.18). The peak and average runoff flow during the last four hours of this interval were 600 gpm and 288 gpm, respectively. This translates to a stormwater runoff volume of nearly 700,000 gallons over four hours. Although no additional rainfall data has been collected at the study area since 2002, the 2002 data indicates that large volumes of runoff from the steep upper/inland portion of the watershed flows down onto Beach Road and enters the lagoon via surface sheet flow during large rain events.

## C.7.2 SEDIMENT DELTA SURVEYS

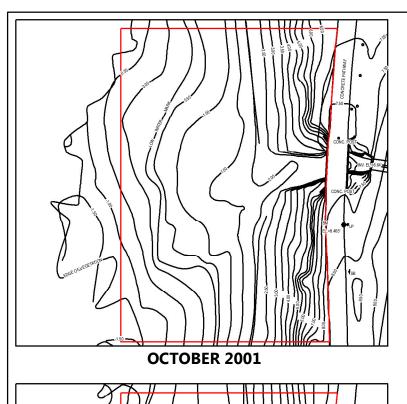

In an effort to quantify the sediment load entering the lagoon via stormwater runoff, three sediment deltas were surveyed five times from 2001 to 2002, during both the wet and dry seasons. Sediment deltas at Drains 4, 6, and 11 were surveyed. The approximate volumes of the sediment deltas are presented in Table C.20. Figures C.5 through C.7 depict sediment delta contours based on survey points established during five discrete monitoring events and present a comparison between the measured delta volumes and the corresponding monthly rainfall data during each monitoring event.

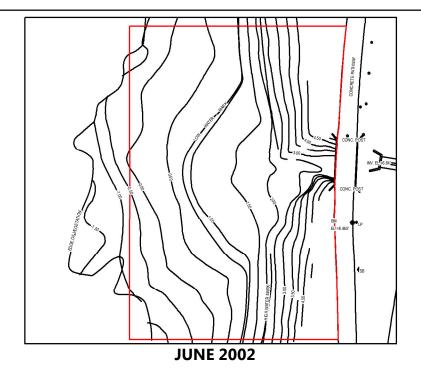

**Table C.20: Sediment Delta Volumes**

NA = not applicable

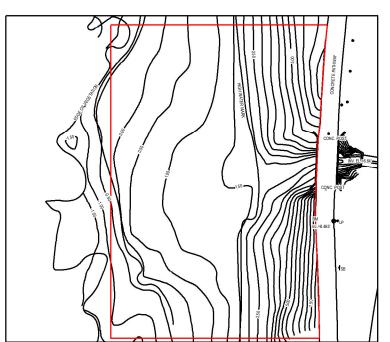

The change in sediment delta volume throughout the study interval was notable, particularly at Drain 4. The sediment delta adjacent to Drain 4 increased by nearly 300 cubic yards from June 2002 to August 2002, and then decreased by 336 cubic yards from August 2002 until October 2002. The monthly rainfall in August 2002 was 11.46 inches, which likely contributed to the loss of sediment from this delta. The volume of sediment lost was most likely washed into the lagoon during the two-month period. The sediment deltas at Drain 6 and Drain 11 also experienced gains and losses of sediment, although

not as much as Drain 4 and at different times of the year. The sediment delta volume at Drain 6 decreased from June 2002 to October 2002, and increased from October 2002 to December 2002. The total volume of sediment lost from the three deltas during the study interval was 478 cubic yards.

In addition to the field studies collected during this portion of the study, a watershed analysis was performed for the site using the computer software program Hydrologic Modeling System HEC-HMS (Community Planning & Engineering, Inc., 2012). The watershed analysis used storm event data from the *Rainfall-Frequency Study, Saipan, CNMI* (Environet, 2003). The watershed analysis report and the resulting drainage design are included as Appendix E of the Ecosystem Restoration Report (ERR).

C.8
Lagoon Water Quality Investigation

#### APPENDIX C.8

#### LAGOON WATER QUALITY INVESTIGATION

In order to obtain general lagoon water quality data, lagoon water samples were collected by the Commonwealth of the Northern Mariana Islands (CNMI) Division of Environmental Quality (DEQ) personnel from February 2002 to February 2003. Samples were collected in nearshore waters adjacent to Drains 4, 6, 11, and 14 (Figure C.8). Samples were analyzed for microbiological and chemical parameters by the DEQ Environmental Surveillance Laboratory.

Table C.21 summarizes the water sample analytical results collected at Drains 4, 6, 11, and 14 from February 2002 to February 2003. The analytical results were compared against the CNMI water quality criteria for Class AA marine waters (DEQ, 2010). Water quality standards for several of the parameters (salinity, temperature, and turbidity) are in terms of deviation from ambient conditions. Ambient conditions have not been specified for the lagoon area; therefore, determining water standard exceedances is difficult for these parameters. In Table C.21, a turbidity of 2.5 was considered as the value for a healthy reef system, thus values exceeding 2.5 were shaded to indicate an exceedance. During the 2002-2003 sampling period, water quality standard exceedances were regularly observed for instantaneous enterococci measurements, dissolved oxygen (DO), turbidity, hydrogen activity (pH), nitrate, and orthophosphate, although strong correlations were not noted. The nutrients nitrate and orthophosphate currently have not been monitored by DEQ for more than six years because of the known problems with the accuracy of the previously used spectrophotometer method and because of unacceptable quality control samples. The accuracy of the nutrient data collected during the 2002-2003 sampling period may be questionable, nonetheless it was included here as a reference.

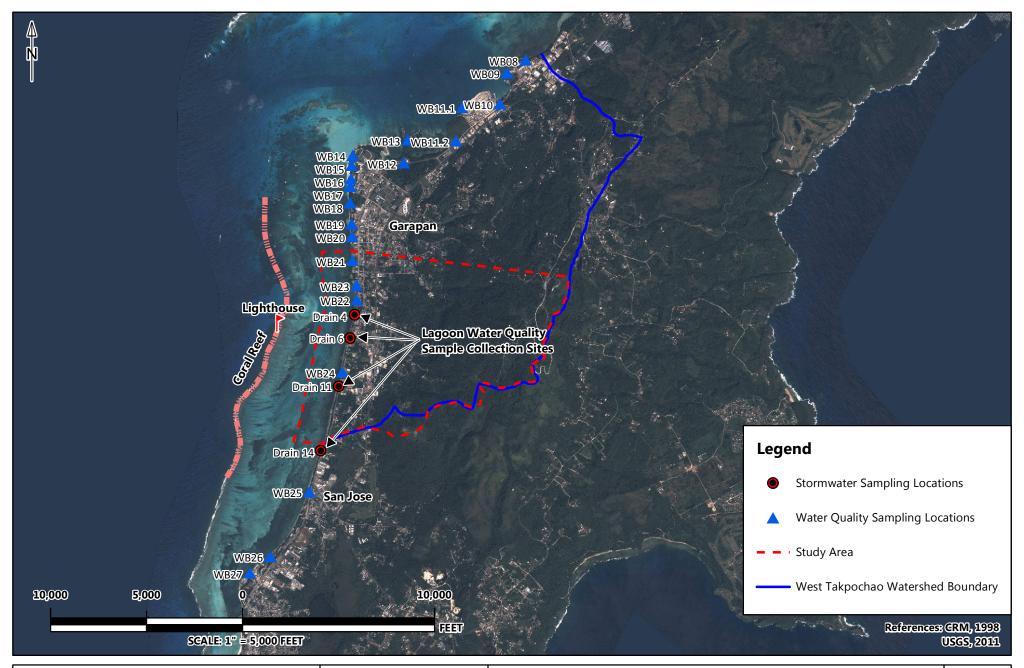

Average values of the water quality sample results for the 2002-2003 sampling period during the wet season (July through November) and dry season (December through June) were calculated for all parameters except fecal coliform and are presented in Table C.22. Enterococci values were consistently higher at all four sample locations during the wet season than during the dry season, as was turbidity at Drains 4, 6, and 11. Salinity was consistently higher during dry season sampling events at all four sample locations, as were DO and chloride. These patterns fit the general presumption that nearshore lagoon waters are affected by an increased volume of stormwater runoff during the rainy season, leading to an increase in turbidity and microbial contamination. During the dry season, less freshwater runoff is experienced, leading to higher salinities and chlorides, and lower turbidity and less microbial contamination.

The DEQ currently monitors 38 fixed stations along Saipan's most used west coast beaches on a weekly basis for microbiological and chemical parameters. Four of these fixed stations (WB 21, WB 22, WB 23, and WB 24) occur within the study area (Figure C.8). Table C.23 presents the data collected at these four stations from July 2010 to June 2011. During the 2010-2011 monitoring period, water quality standard exceedances were regularly observed for instantaneous and geomean (GM) enterococci measurements, DO, turbidity, and pH, although strong correlations among the measured parameters were not noted. As mentioned earlier, nutrient data during this sampling period is not available.

As a comparison, average values of the 2010-2011 monitoring data for the wet season and dry season were also calculated. Results are presented in Table C.24. A significant correlation was not observed between seasonal discharges and water quality parameters during the 2010-2011 sampling period, suggesting that other factors are also contributing to the observed contaminant loadings entering the lagoon. These factors may include periodic releases of pollutants not associated with rainfall, a better system of contaminant uptake, a natural filtration or buffering of stormwater runoff prior to discharging into the lagoon, or a difference in upgradient land use.

**Bold** values exceed CNMI water quality standards.

Grey-shaded values exceed 2.5, a non-regulatory assigned value for coastal waters to approximate ambient conditions in a healthy reef system.

<sup>&</sup>lt;sup>1</sup> GM in not less than four samples over a 30-day period. <sup>2</sup> Shall not exceed ambient by more than the stated value.

<sup>\*</sup> For the purpose of this study, analytical results were compared against the single sample standard.

<sup>- =</sup> data not available

<sup>% =</sup> percent

<sup>‰ =</sup> per mil (parts per thousand)

<sup>°</sup>C = degrees Celsius

GM = geometric mean

CFU = colony forming units

mg/L = milligrams per liter

ml = milliliter

NA = not applicable

ND = not detected

 $NTU = nephelometric \ turbidity \ units$ 

 $PO_4$  = orthophosphate

Table C.22: Average Values of Lagoon Water Quality Results, Wet versus Dry Season, 2002-2003

<sup>% =</sup> percent

% = per mil (part per thousand)

°C = degrees Celsius

CFU = colony forming units

mg/L = milligrams per liter

ml = milliliter

NTU = nephelometric turbidity units

 $PO_4$  = orthophosphate

Table C.23: Lagoon Water Quality Results, 2010-2011

<sup>&</sup>lt;sup>1</sup>GM in not less than four samples over a 30-day period.

GM = geometric mean

CFU = colony forming units

ml = milliliter

 $NTU = nephelometric \ turbidity \ units$ 

 $PO_4$  = orthophosphate

**Bold** values exceed CNMI water quality standards.

Grey-shaded values exceed 2.5, a non-regulatory assigned value for coastal waters to approximate ambient conditions in a healthy reef system.

<sup>&</sup>lt;sup>2</sup> Shall not exceed ambient by more than the stated value.

<sup>- =</sup> data not available

<sup>% =</sup> percent

<sup>% =</sup> per mil (parts per thousand)

<sup>°</sup>C = degrees Celsius

Table C.24: Average Values of Lagoon Water Quality Results, Wet versus Dry Season, 2010-2011

# Section 1 Hydrology

Three low-lying areas in the West Takapochao watershed were selected for evaluation as possible drainage detention basins. These sites include vacant land adjacent to Quartermaster Road, the China House, and the Cockfight Arena; see Figure 1. These three areas currently flood during heavy rains.

During heavy rains the initial rainfall will produce the most sediment, nutrients and pollutants, known as the "first flush." In order to represent this "first flush" a one-hour intensity storm over a one hour duration has been applied to the analyses. Three storm events were evaluated in this report; 2-year, 5-year, and 10-year recurrence storms. Storm event data were utilized from the "Rainfall – Frequency Study, Saipan Commonwealth of Northern Marianas Islands, Contract No. DACA83-01-D-0014", prepared by Environet, Incorporated, dated April 2003.

Table 1: Saipan International Airport Rainfall Data – 60 minute Duration Storm Events

| Return Frequency | Cumulative Rainfall (inches) | Rainfall Intensity (inches/ hour) <sup>1</sup> |
|------------------|------------------------------|------------------------------------------------|
|                  | /                            | /                                              |
| $X_{10}$         | 3.06                         | 3.06                                           |
| $X_5$            | 2.61                         | 2.61                                           |
| $\overline{X_2}$ | 1.93                         | 1.93                                           |

1 From Table 4-6 and Table 4-7 in the "Rainfall – Frequency Study"

The watershed analysis for each storm and site was performed using the computer software program Hydrologic Modeling System HEC-HMS, version 3.5 and can be found in Appendix A. The Soil Conservation Service (now the Natural Resource Conservation Service) curve number was applied to the analyses along with the SCS unit hydrograph to symbolize the direct runoff over the watersheds. The lag time for the unit hydrograph was assumed to equal the time of concentration. No baseflow is assumed in the analyses. The simulations were ran over a 24-hour time period.

# Section 2 Hydraulics

HEC-HMS version 3.5 was also used to perform the analysis on the proposed detention basins. Elevation-area functions were used to specify the storage relationships. The outlet structure routing method was used to perform the reservoir routing. The simulations were routed through reinforced concrete outlet pipes (RCP) that were sized according to the analysis and existing site conditions. The RCP outlet pipes are to be wrapped in filter cloth and gravel, and are to be located 1'-2' above the bottom of the detention basin. This will allow sediment to settle out in the basin and will require periodic removal of sediment from the basins. The simulations were ran over a 24-hour time period.

Each watershed was analyzed separately for the three storm events. A preliminary design of the required improvements was completed for each event and each site. The preliminary designs are further explained in detail in the following sections. Each design is based upon 100% of the design storm runoff passing through the detention basin. The analysis assumes that the topographic conditions and existing drainage facilities adequately convey storm flows to the proposed detention basins. Detailed as-built information and condition surveys about existing storm drain systems were not available; nor were detailed surveys of the proposed sites. This information will be necessary for implementation of the final design of the proposed detention basins. For the purposes of preliminary design and comparison, assumptions were made regarding the sites and existing drain systems. These assumptions are identified in the following sections and/or on the figures. It should also be noted that the Quartermaster Site and the Cock Fight Arena are currently on private property. This report does not address acquiring such properties and that it is assumed that all lands used for the proposed detention basins can or will be acquired by the CNMI Government.

# Section 3 Quartermaster Site

## 3.1 Existing Conditions

The Quartermaster Site is located at the northwest corner of the intersection of Quartermaster Road and Middle Road. The site is currently vacant and overgrown with vegetation. The site generally slopes to the southwest corner at approximately 4-5%.

The watershed which is tributary to the site is approximately 109 acres. The wtershed is mostly undeveloped, mountainous terrain. The bottom of the watershed, adjacent to Middle Road is more moderately sloped and developed with residential and commercial buildings, roads, and associated improvements. The watershed has an average slope of approximately 23%.

The storm runoff concentrates along the east side of Middle Road at a low point on the northern side of the Quartermaster Road intersection. There is an existing catch basin at this location which will continue to be utilized.

Condition of existing drainage facilities is unknown and may require repair or replacement. Existing facilities were assumed as shown on figures 2.1, 2.2 and 2.3.

#### 3.2 2-Year Storm Event

The 2-year storm event will produce a peak runoff of approximately 20.8 cfs. The runoff will be routed through a proposed detention basin providing approximately 1.52 ac-ft of storage from elevations 23 feet - 32 feet. Discharge from the detention basin will enter an existing swale via an 18 inch RCP outlet and flow along the north side of Quartermaster Road running westward toward Beach Road and the Lagoon. Figure 2.1 depicts the required improvements to the Quartermaster site to detain the 2-year storm event. With the proposed improvements, the detention basin will pond approximately to elevation 26.8 feet, and the peak discharge from the detention basin will be approximately 7.7 cfs.

#### 3.3 5-Year Storm Event

The 5-year storm event will produce a peak runoff of approximately 75.0 cfs. The runoff will be routed through a proposed detention basin providing approximately 4.89 ac-ft of storage from elevations 23 feet – 32 feet. Discharge from the detention basin will enter an existing swale via an 18 inch RCP outlet and flow along the north side of Quartermaster Road running westward toward Beach Road and the Lagoon. Figure 2.2 depicts the required improvements to the Quartermaster site to detain the 5-year storm event. With the proposed improvements, the detention basin will pond approximately to elevation 27.9 feet, and the peak discharge from the detention basin will be approximately 12.4 cfs.

#### 3.4 10-Year Storm Event

The 10-year storm event will produce a peak runoff of approximately 118.5 cfs. The runoff will be routed through a proposed detention basin providing approximately 6.92 ac-ft of storage from elevations 23 feet – 32 feet. Discharge from the detention basin will enter an existing swale via an 18 inch RCP outlet and flow along the north side of Quartermaster Road running westward toward Beach Road and the Lagoon. Figure 2.3 depicts the required improvements to the Quartermaster site to detain the 10-year storm event. With the proposed improvements, the detention basin will pond approximately to elevation 28.9 feet, and the peak discharge from the detention basin will be approximately 14.5 cfs.

# Section 4 China House Site

#### 4.1 Existing Conditions

The China House Site is located near the China House Restaurant and the driving range, about halfway between Middle Road and Beach Road. The site is currently undeveloped and overgrown with vegetation. However there are abandoned structures on the property which will need to be demolished. The site generally slopes to the west at approximately 3.5%.

The watershed which is tributary to the site is approximately 344 acres. The watershed is mixed between undeveloped, mountainous terrain and areas developed with residential and commercial buildings, roads, and associated improvements. The watershed has an average slope of approximately 16%.

The storm runoff concentrates along the east side of Middle Road at a low point in the road. There is an existing catch basin at this location which will continue to be utilized. Each storm event requires improvements starting at this existing catch basin, which are further detailed in the following sections.

Condition of existing drainage facilities is unknown and may require repair or replacement. Existing facilities were assumed as shown on figures 3.1, 3.2 and 3.3.

#### 4.2 2-Year Storm Event

The 2-year storm event will produce a peak runoff of approximately 51.9 cfs. The runoff will be routed through a proposed detention basin providing approximately 4.77 ac-ft of storage from elevations 20 feet – 29 feet. An 18 inch RCP outlet will discharge from the detention basin to an existing double 30 inch culvert under Beach Road, discharging to the Lagoon. Figure 3.1 depicts the required improvements to the China House site to detain the 2-year storm event. With the proposed improvements, the detention basin will pond approximately to elevation 24.4 feet, and the peak discharge from the detention basin will be approximately 15.0 cfs.

#### 4.3 5-Year Storm Event

The 5-year storm event will produce a peak runoff of approximately 178.6 cfs. The runoff will be routed through a proposed detention basin providing approximately 13.54 ac-ft of storage from elevations 19 feet – 29 feet. An 18 inch outlet pipe will discharge from the detention basin to an existing double 30 inch culvert under Beach Road, discharging to the Lagoon. Figure 3.2 depicts the required improvements to the China House site to detain the 5-year storm event. With the proposed improvements, the detention basin will pond approximately to elevation 26.8 feet, and the peak discharge from the detention basin will be approximately 15.6 cfs.

#### 4.4 10-Year Storm Event

The 10-year storm event will produce a peak runoff of approximately 284.0 cfs. The runoff will be routed through a proposed detention basin providing approximately 15.84 ac-ft of storage from elevations 18 feet – 30 feet. A 36 inch outlet pipe will discharge from the detention basin to an existing double 30 inch culvert under Beach Road, then discharging to the Lagoon. Figure 3.3 depicts the required improvements to the China House site to detain the 10-year storm event. With the proposed improvements, the detention basin will pond approximately to elevation 27.9 feet, and the peak discharge from the detention basin will be approximately 91.1 cfs.

# Section 5 Cock Fight Arena Site

## 5.1 Existing Conditions

The Cock Fight Arena Site is located on the east side of Middle Road, surrounding the existing Cock Fight Arena. The site is currently developed as a Cock Fight Arena, and portions were utilized as a quarry. The site generally slopes to the quarry pit.

The watershed which is tributary to the site is approximately 413 acres. The watershed is mainly undeveloped, mountainous terrain with some minor areas developed with residential and commercial buildings, roads, and associated improvements. The watershed has an average slope of approximately 12%.

Condition of existing drainage facilities is unknown and may require repair or replacement. Existing facilities were assumed as shown on figures 4.1, 4.2 and 4.3.

#### 5.2 2-Year Storm Event.

The 2-year storm event will produce a peak runoff of approximately 20.9 cfs. The runoff will be routed through a proposed detention basin providing approximately 11.85 ac-ft of storage from elevations 37 feet – 45 feet. An 18 inch outlet pipe will discharge from the detention basin to the Lagoon following existing paved roadways. Figure 4.1 depicts the required improvements to the Cock Fight Arena site to retain the 2-year storm event. The pit is currently sufficiently sized to accommodate the 2-year storm event; however, inlet improvements are required and outlet improvements are recommended. With the proposed improvements, the detention basin will pond approximately to elevation 40.3 feet, and the peak discharge from the detention basin will be approximately 4.4 cfs.

Based upon the minimal topographic information provided, it appears that the Cock Fight Arena's finish floor is approximately 43 feet in elevation. Additional investigation of the Arena and the pit should be performed to verify that ponding will not flood the Arena.

#### 5.3 5-Year Storm Event

The 5-year storm event will produce a peak runoff of approximately 95.9 cfs. The runoff will be routed through a proposed detention basin providing approximately 11.85 ac-ft of storage from elevations 37 feet – 45 feet. An 18 inch outlet pipe will discharge from the detention basin to the Lagoon following existing paved roadways. Figure 4.2 depicts the required improvements to the Cock Fight Arena site to detain the 5-year storm event. The pit is currently sufficiently sized to accommodate the 5-year storm event; however, inlet and outlet improvements are required. With the proposed improvements, the detention basin will pond approximately to elevation 43.4 feet, and the peak discharge from the detention basin will be approximately 14.0 cfs.

Based upon the minimal topographic information provided, it appears that the Cock Fight Arena's finish floor is approximately 43 feet in elevation. Additional investigation of the Arena and the pit should be performed to verify that ponding will not flood the Arena. If flooding will occur, modifications can be made to the pit, or outlet structures. Alternatively, the Arena may be demolished.

#### 5.4 10-Year Storm Event.

The 10-year storm event will produce a peak runoff of approximately 164.7 cfs. The runoff will be routed through a proposed detention basin providing approximately 14.23 ac-ft of storage from elevations 37 feet – 45 feet. A 24 inch outlet pipe will discharge from the detention basin to the Lagoon following existing paved roadways. Figure 4.3 depicts the required improvements to the Cock Fight Arena site to detain the 10-year storm event. Improvements to the pit will include some grading at the base of the existing pit, the walls of the pit and limits of the pit will not require expansion. In addition, inlet and outlet improvements are required. With the proposed improvements, the detention basin will pond approximately to elevation 44.6 feet, and the peak discharge from the detention basin will be approximately 30.3 cfs.

Based upon the minimal topographic information provided, it appears that the Cock Fight Arena's finish floor is approximately 43 feet in elevation. Additional investigation of the Arena and the pit should be performed to verify whether ponding will flood the Arena. It appears likely that the Arena will need to be demolished, or additional modifications will need to be made to the pit, or outlet structures.

# Section 6 Conclusion

For each of the alternatives the detention basins were designed to provide adequate storage, detention times and outlet design to reduce outflow and improve water quality.

In addition to the detention basins, each site will include a perimeter fence and a paved access driveway to the bottom of each basin for safety and maintenance.

Additional topographic information will be required to finalize actual designs for any selected sites. Condition assessments of existing drainage facilities should also be performed.

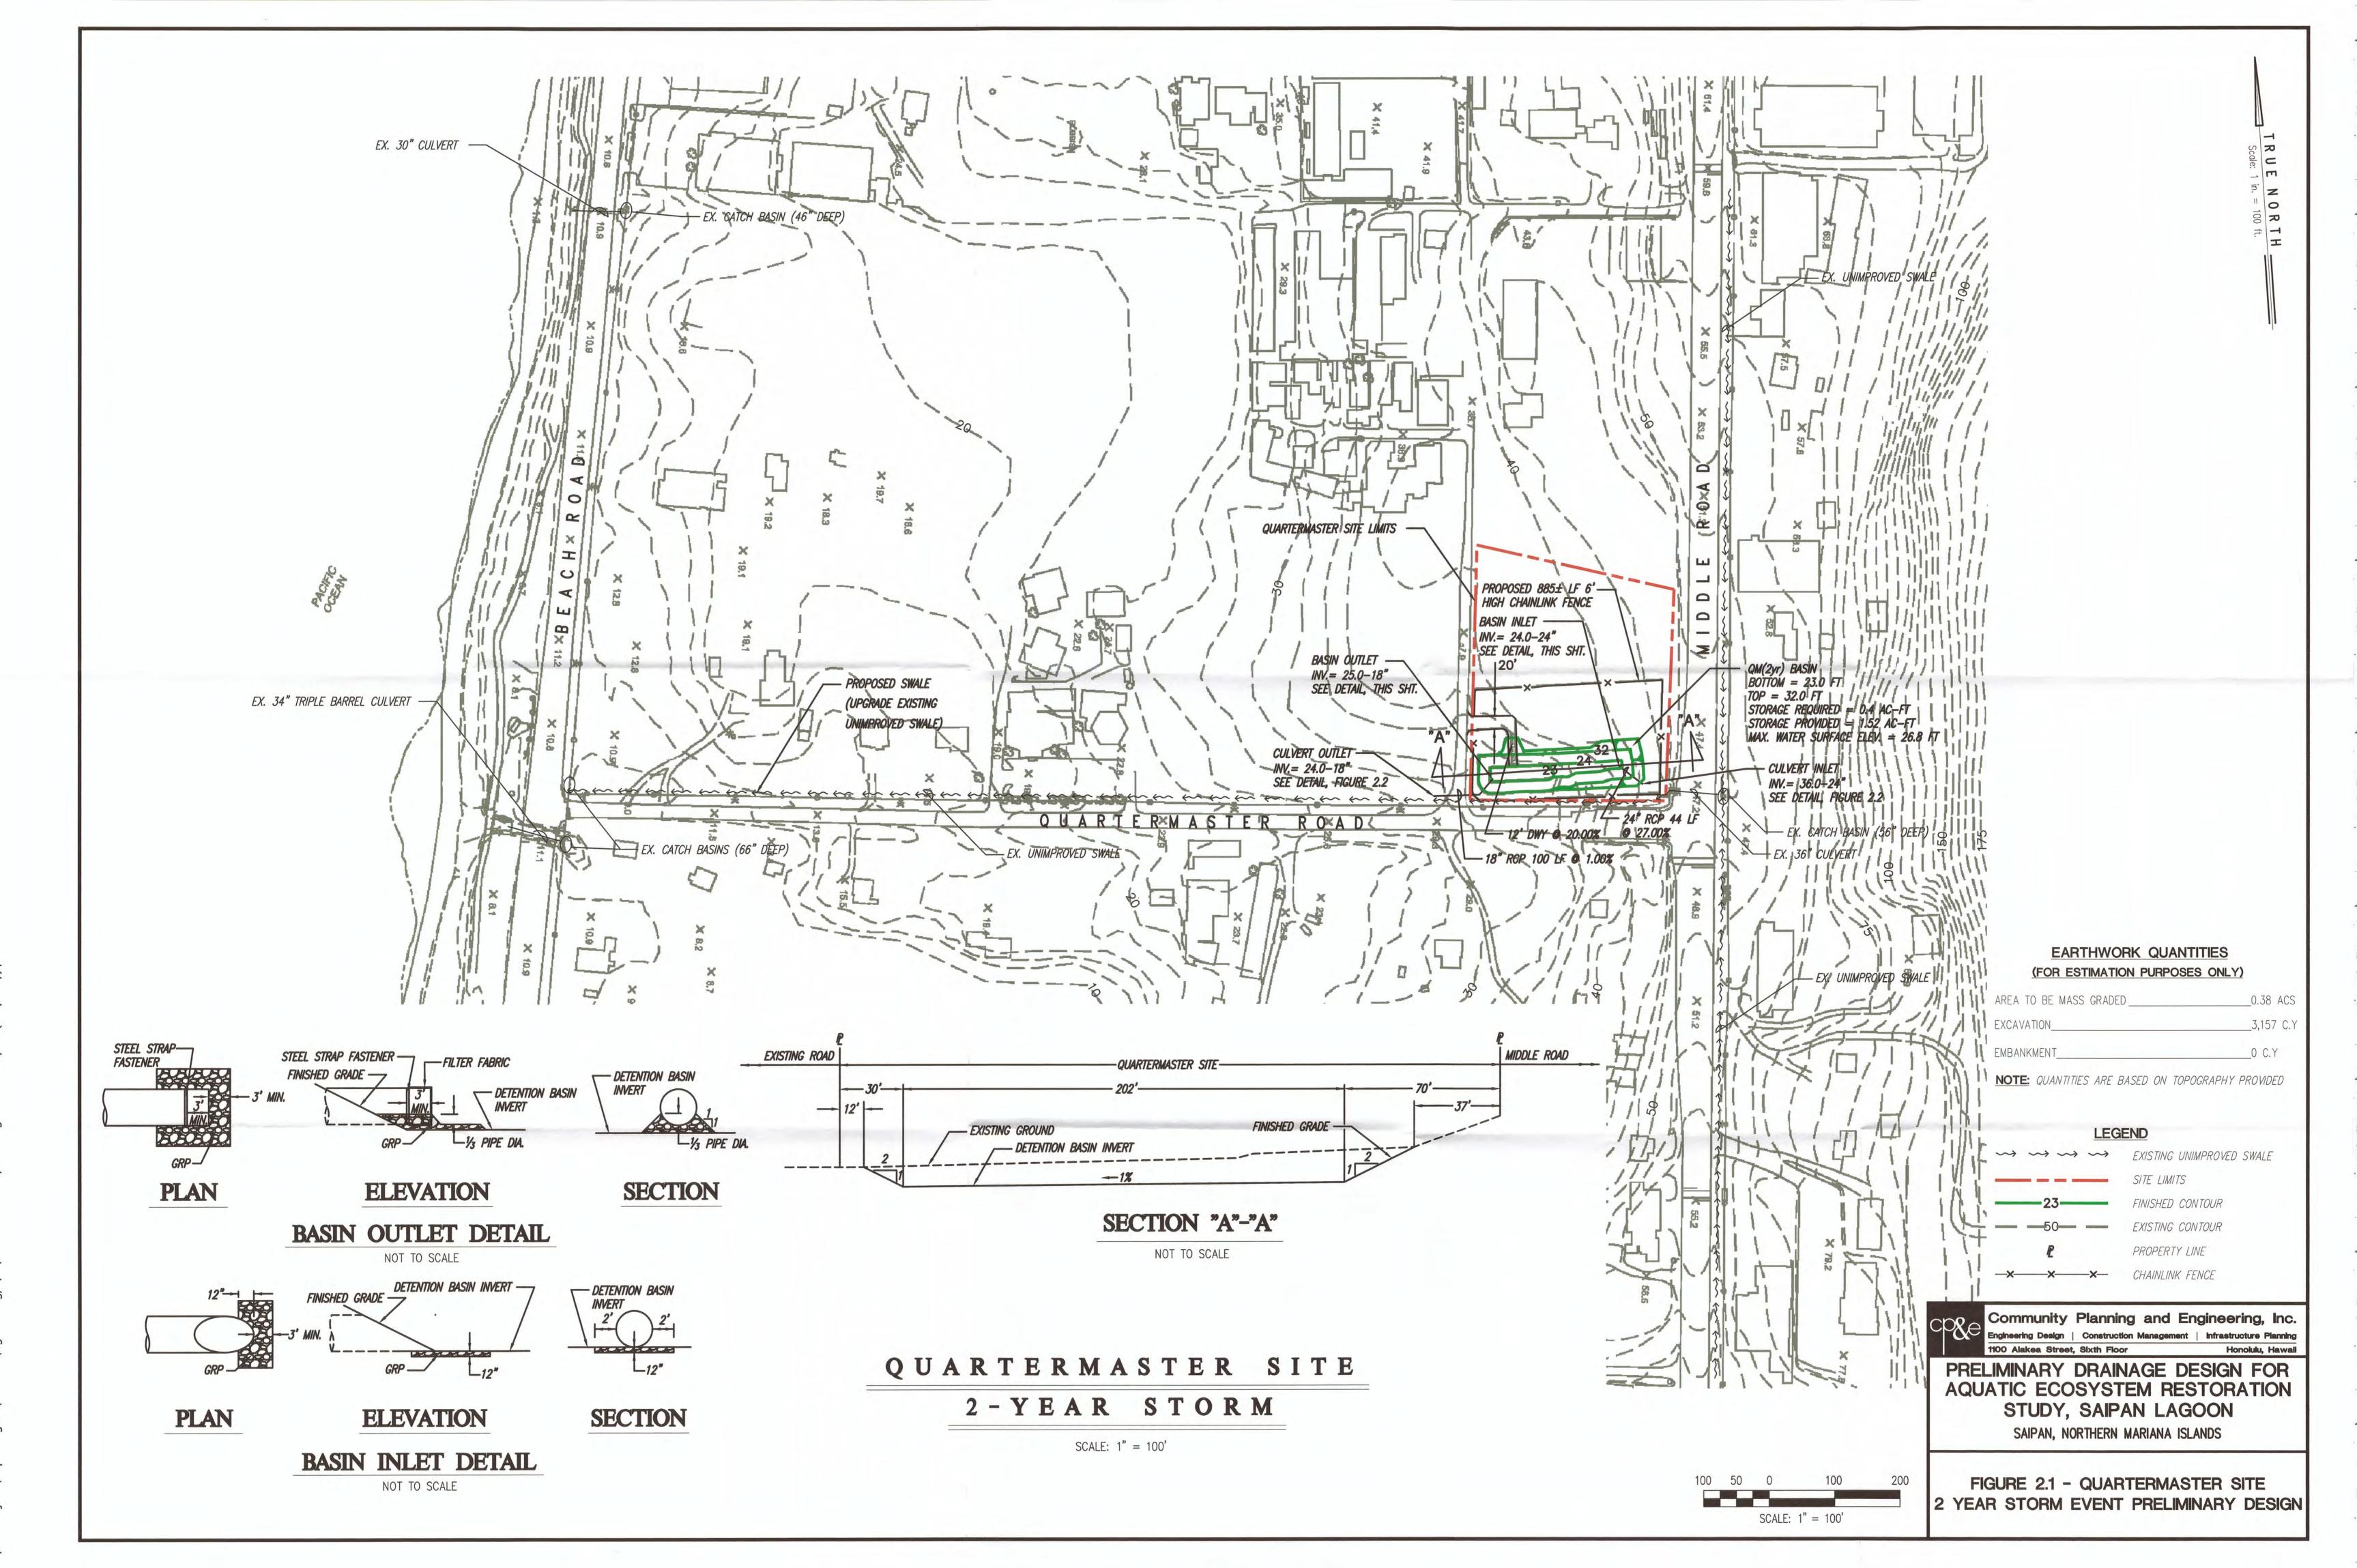

The analysis provided herein along with the preliminary designs proposed, provide the U.S. Army Corps of Engineers (USACOE) with information to prepare cost-benefit analysis of the proposed sites and each of the storm event situations.

#### **EXECUTIVE SUMMARY**

Numerous studies have been conducted throughout the island and the study area by various US agencies as well as the CNMI over the last few years. A phase I Aquatic Ecosystem Restoration study was conducted in June 2001 by Environet, Inc., under contract to USACE. A draft ERR was also prepared by the same company in June 2001, and they are currently working on a final ERR for 2012. The subject study is a continuing authorizes program authorized under section 206 of the Water Resources Development Act of 1996, and the purpose of this report is support the real estate requirements for a proposed project. At present the final alternative has not been defined and as such three alternative sites are valued with three flood frequency levels.

The study area involves approximately 2 miles of Lagoon along the west side of Saipan from about Fishing Base to Quartermaster Road. Three potential sites have been identified as well as the project features associated with those sites. The three sites from north to south are the Cock Fight Arena site, China House site, and Quartermaster Road site. Each site requires a retention basin and outlet works as the primary features. Two of the sites front on public roads and have readily available access for the project. China House site will require acquisition of adequate access. The specific route of this access has not been determined but has been estimated for planning purposes. A temporary staging area will be required and has been estimated for each site. There will be no requirement for disposal as this will be handled by a public land fill site.

The non-Federal sponsor is the CNMI government. They have not been assessed as to their acquisition capabilities but are believed to be fully capable. Per guidance, the CNMI will need to acquire the LERRD's for the project that they do not currently own. The estimated real estate costs for each of the sites is as follows:

Cock Fight Arena (all flood frequencies) = \$1,012,000 China House (all flood frequencies) = \$589,200 Quartermaster (2 year event) = \$431,000 (5 year event) = \$578,700 (10 year event) = \$817,700

The information provided in this report meets the requirements of EC 405-1-11.

#### 1. AUTHORITY/PURPOSE

The study is being investigated under the authority of Section 206 of the 1996 Water Resources Development Act (WRDA), as amended. Section 206 authorizes the Secretary of the Army to carry out a program of aquatic ecosystem restoration with the objective of restoring degraded ecosystem structure, function, and dynamic processes to a less degraded, more natural condition, considering the ecosystem's natural integrity, productivity, stability and biological diversity. This authority is primarily used for manipulation of the hydrology in and along bodies of water, including wetlands and riparian areas. It is a Continuing Authorities Program (CAP), which focuses on water resource related projects that are relatively small in terms of scope, cost and complexity.

The Commonwealth of Northern Marianas Islands (CNMI) has requested the assistance of USACE in determining a cost effective means to improve the aquatic ecosystem of the Saipan Lagoon from approximately the Fishing Base in Garapan to Quartermaster Road to the south. A phase I report has been prepared and an Environmental Restoration Report was originally prepared in 2007 and is currently being updated to 2012. Currently the study is in the Plan Formulation Stage in preparation of a selected NER plan for implementation.

This REPR will be included as a part of the Engineering Documentation Report and will be encompassed in the cost estimate for determination of the selected plan.

### 2. DESCRIPTION

The proposed project is located along an approximate 2 mile stretch of lagoon along the west side of Saipan from about Fishing Base to Quartermaster Road. The project area involves three low lying areas in the West Takapochao watershed; the cockfight arena site; the China House site and the Quartermaster Road site. These three sites encompass a large watershed drainage area in the mountains above the sites.

Middle Street provides the primary north/south access through the area and is a major traffic arterial. The cockfight arena site and the Quartermaster Road site front on Middle Street and the China House site is approximately mid was between Middle Street and Beach Road. The area is characterized as mixed urban and rural with commercial usage along Middle Street. The mountainous area above Middle Street is most undeveloped but with a scattering of residential development.

Climate is summarized as warm and humid and the study area has an average rainfall of 75 to 80 inches per year.

Topography is generally level to slightly sloping and all three sites tend to flood during heavy rainfall. Drainage is not well defined and most of the runoff is on the surface.

The ownerships impacted and required for acquisition of the fee interest for the three sites are as follows:

| <u>Parcel</u>                        | <u>Owner</u>                  | Area in Square Meters                     |                                         |                                          |

Cockfight arena site is located just east of Middle Road and between Commonwealth Road and Japon Road. The property is improved with the cock fight arena, which is a large approximately 12,500 square foot structure which is in fair condition. It is a minimal functional building and will be acquired and demolished for the project. Parcel 078D01 is an entire acquisition and parcels 25-4 and EA 693-2 are a partial acquisitions. The remainders on the partial acquisition are of sufficient size and have adequate access to eliminate damages. In addition to the site itself, the preliminary plans call for approximately 2,200 lineal feet of 18" RCP for the diversion outlet flow.

China House site is located about midway between Middle Road and Beach Road. There is no direct public access to this property and it is unimproved. The acquisition will involve the entire ownership and there is no anticipated severance damage associated with the acquisition. This acquisition may involve two ownerships but the property is listed as one lot. There is an estimated 1,823 square meters of channel improvement easement required for the out-flow works. This site will also require permanent access, which is estimated from Middle Road and encompasses approximately 972 square meters.

Quartermaster Road site is located at the northwest corner of Middle Road and Quartermaster Road, and it has frontage on both roads. There are no improvements on this site. Parcel 1826-4 is an entire acquisition; parcel 1826-R1 is a partial acquisition of approximately half of the ownership in the 10 year event and the acquisition takes the Middle Street frontage. The remainder is damaged due to a loss of street frontage. Parcel 1822 is an acquisition of a small area of the ownership but it doesn't damage the remaining ownership. This site will require approximately 3,400 square meters for channel improvements to an existing swale.

All of the sites will require a temporary work area or staging area during construction. This has been estimated at approximately 2,024 square meters and is estimated for a one year construction period. This feature has been added to each alternative.

The China House site and Quartermaster Road site require excavation of material. Much of the material will be used on site for berms and the remaining excess will be disposed of in a public land fill. As such, there is no provision for a disposal LERRD requirement.

#### 3. SPONSOR'S REAL ESTATE INTERESTS

The sponsor owns or has owned various parcels in the area but the current extent is unknown. If the sponsor currently owns some of the parcels they will still receive credit for the market value of the land but will have no acquisition costs associated with that parcel. None of the parcels were acquired in anticipation of the proposed federal project.

#### 4. ESTATES TO BE ACQUIRED

#### Fee

The fee simple title to (the land described in Schedule A) (Tracts Nos. , and ), subject, however, to existing easements for public roads and highways, public utilities, railroads and pipelines.

#### TEMPORARY WORK AREA EASEMENT:

A temporary easement and right-of-way in, on, over and across (the land described in Schedule A) (Tracts Nos., and), for a period not to exceed\_\_\_\_\_\_, beginning with date possession of the land is granted to the United States, for use by the United States, its representatives, agents, and contractors as a (borrow area) (work area), including the right to borrow and/or deposit fill, spoil and waste material thereon). (move, store and remove equipment and supplies, and erect and. remove temporary \* structures on the land and to perform any other work necessary and incident to the construction of the

Project, together with the right to trim, cut, fell and remove, therefore all trees, underbrush, obstructions, and any other vegetation, structures, or obstacles within the limits of the right-of-way; reserving, however, to the landowners, their heirs and assigns, all such rights and privileges as may be used without interfering with or abridging the rights and easement hereby acquired; subject, however, to existing easements for public roads and highways, public utilities, railroads and pipelines.

### ROAD EASEMENT- PERPETUAL (std estate #11)

A perpetual and assignable easement and right-of-way in, on, over and across (the land described in Schedule A) (Tracts Nos. \_\_\_\_\_, \_\_\_\_, and \_\_\_\_\_) for the location, construction, operation, maintenance, alteration, replacement of (a) road(s) and appurtenances thereto; together with the right to trim, cut, fell and remove therefrom all trees, underbrush, obstructions and other vegetation, structures, or obstacles within the limits of the right-of-way; (reserving, however, to the owners, their heirs and assign, the right to cross over or under the right-of-way as access to their adjoining land at the locations indicated in Schedule B); 5/ subject, however, to existing easements for public roads and highways, public utilities, railroads and pipelines.

#### CHANNEL IMPROVEMENT EASEMENTS

A perpetual and assignable right and easement to construct, operate, and maintain channel improvement works on, over and across (the land described in Schedule A) (Tract Nos. \_\_\_, \_\_, and \_\_\_.) for the purposes as authorized by the Act of Congress approved \_\_\_\_\_, including the right to clear, cut, fell, remove and dispose of any and all timber, trees, underbrush, buildings, improvements and/or other obstructions therefore; to excavate dredge, cut away, and remove any or all of said land and to place thereon dredge or spoil material; and for such other purposes as may be required in connection with said work of improvement; reserving, however, to the owners, their heirs and assigns, all such rights and privileges as may be used without interfering with or abridging the rights and easement hereby acquired; subject, however, to existing easements for public roads and highways, public utilities, railroads and Pipelines.

#### 5. FEDERAL PROJECTS/OWNERSHIP

There are no federal projects or federal lands within the project area.

#### 6. NAVIGATION SERVITUDE

The project sites are all fast land parcels and navigation servitude does not apply to these lands.

### 7. MAPS

Maps depicting the territory of Saipan, the project areas and impacted parcels are attached in the addendum.

### 8. FLOODING

There are no flood plain maps available for the project area, but the subject parcels all experience surface flooding during periods of heavy rainfall.

### 9. BASELINE COST ESTIMATE FOR REAL ESTATE

### **Cock Fight Arena Site**

| Fee Title\$ 596,300                            |  |  |  |  |

#### 10. PL 91-646 RELOCATION BENEFITS

Public Law 91-646, The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, commonly called the Uniform Act, is the primary law for acquisition and relocation activities on Federal or federally assisted projects and programs. The local sponsor is required to follow the guidance in this public law.

The only property that has potential 91-646 benefits is the cock fight arena site. The arena is an operating business and will be acquired if that site is selected as the alternative. No allowance has been made for this business as it may not be acceptable in the law as a legal business, and as such may not be eligible for the benefit.

#### 11. MINERALS

There are no surface of subsurface minerals known that would impact the project or acquisition.

#### 12. ASSESSMENT OF SPONSOR'S ACQUISITION CAPABILITY

An assessment of the sponsor's acquisition capabilities to acquire the land necessary for this project has not been done. However, CNMI is considered fully capable.

#### 13. ZONING

There is no zoning available on the subject properties and no zoning on the island. The area is a mixture of urban and rural.

#### **14. MILESTONES**

The sponsor will begin preliminary acquisition work approximately 6 months prior to PPA execution as follows:

Survey/Maps/Title 90 Days

Legal Descriptions 30 Days Appraisals 90 Days

The sponsor will complete acquisition of LERRD within 180 days after the PPA execution as follows:

Documentation 120 Days
Negotiations 60 Days
Final Subdivision 60 Days
Payments 90 Days

LERRD certification 21 Days

#### 15. PUBLIC UTILITIES RELOCATIONS

There are no known public utilities that are impacted by the project.

#### **16. ENVIRONMENTAL IMPACTS**

Environmental impacts, if any, are discussed in other sections of the Engineering Documentation Report.

#### 17. ATTITUDES OF LANDOWNWERS

No information has been given as to public opinion about the project. To the extent that some local flooding will be reduced and the lagoon ecosystem will be improved, the project should be favorable.

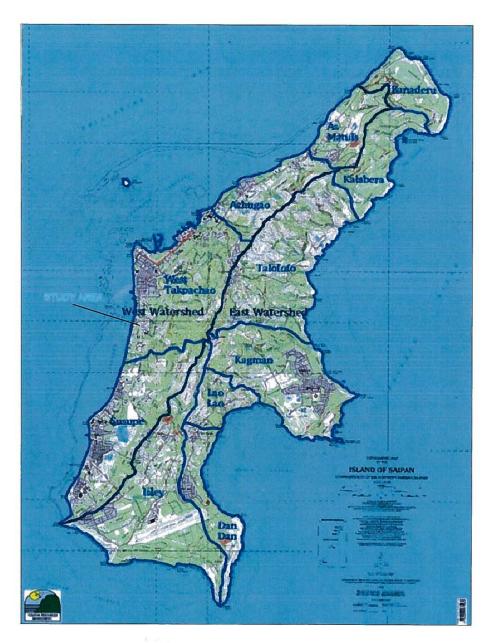

#### **18. NOTIFICATION TO SPONSOR**

The non-Federal sponsor, CNMI, is fully involved in the planning process although they have not been formally notified about the risks of acquiring the LERRD for the project prior to the PPA execution and the Government's formal notice to proceed. The written notice will be given once the final alternative is determined.

Appendix H
Cost Estimates

## SAIPAN LAGOON ECOSYSTEM RESTORATION FEASIBILITY

#### **Total Project Cost Summary**

The Army Corps of Engineers Cost Engineer was given nine alternatives to cost out. There were three different sites with three storm events represented for each site. An estimate was made for each alternative. These estimates were given to Environet, Inc. to conduct an incremental cost analysis and determine a combination of the three sites that would produce the most cost effective plan. From this incremental cost analysis, seven combinations were derived and four (including a no action plan) plans were chosen for further analysis. Environet, Inc. gave the four combination alternatives to the Corps and the construction costs from these site/storm combinations were used to determine a contingency value for each alternative.

The Corps performed an Abbreviated Cost and Schedule Risk Analysis for each combination alternative to determine a contingency value. First, a risk register was created for potential risk areas for each risk element to include, Project Scope, Acquisition Strategy, Construction Complexity, Volatile Commodities, Quantities, Fabrication & Project Installed Equipment, Cost Estimating Method, and External Project Risks. The PDT reviewed these risks and rated them for this project. Then a risk register was used to calculate a total contingency for each alternative. The Abbreviated Risk Analysis tables are provided in this Appendix for each combination alternative.

The contingencies were then inputted into the Total Project Cost Summary (TPCS) along with the Lands and Damages cost (taken from the Real Estate Planning Report, dated 2 October 2012), the Planning, Engineering and Design cost, and the Construction Management cost. All of these costs were added together, along with the monies spent and an escalation factor to determine the Total Project Cost. The Total Project Cost Summary tables are provided in this Appendix for each combination alternative.

The following assumptions were made in determining the cost estimates for each alternative:

- Project duration is 16 months.
- Project Management cost is \$237k.
- Planning and Environmental Compliance cost is \$1,099k.
- Engineering and Design cost is \$244k.
- Engineering Tech Review ITR & VE cost is \$50k.
- Contracting and Reprographics cost is \$25k.
- Engineering During Construction cost is \$100k.

• Construction Management cost is \$346k. Cost includes labor, travel and QA testing.

#### **Post-Construction Monitoring**

Post-Construction Monitoring includes costs associated with the monitoring/sampling effort, project management, and preparation of annual monitoring reports for 5 years. Costs are included in the estimate for 5 monitoring events (Year 1, 3, 5, 7, 10) after construction.

#### **Cost Assumptions**

#### Saipan Lagoon Ecosystem Restoration - ROM

#### PM: Milton Yoshimoto

- 1. The estimate is based on the Environmental Restoration Report (Pre-Draft), dated January 2013, and the Preliminary Drainage Design.
- 2. It is estimated that the construction will take 16 months to complete and the overall project will take 20 months.
- 3. The construction start date is estimated to begin around July 2015.
- 4. The construction mid point is estimated to be January 2016.
- 5. Escalation Factor used is 3.21.(3/12 6/13)
- 6. For Alternative 2, items that are included in WBS 3 Reservoirs is everything except for drainage item and post-construction monitoring.
- 7. For Alternative 3, items included in WBS 3 are everything except for drainage, driveway and basin, and post-construction monitoring.
- 8. For Alternative 4, items included in WBS 3 are everything except for drainage, driveway and basin, and post-construction monitoring.
- 9. Contingency is based on Abbreviated Cost and Schedule Risk Analysis.
- 10. SIOH is based on the duration of 16 months for the total project time.
- 11. CPM: Start date is 6/1/15 and End date is 9/30/16.
- 12. Rain Delay is 14 working days.
- 13. This estimate contains no overtime to complete the project.
- 14. Quantities are provided by Community Planning and Engineering, Inc.
- 15. Calculations based on plans are presented as take-offs (see QTO sheet).
- 16. The base estimate includes the fuel prices as follows for Saipan:

Electricity: \$0.36

Gas: \$5.23

Diesel (Off-Road): \$5.32 Diesel (On-Road): \$5.32

- 17. Sales Tax is 0%.
- 18. Labor rates were created as a MII Library called Saipan Labor rates. These rates were created in 2008. Labor rates were escalated to 2013 using the EM 1110-2-1304 Quarterly Cost Indexes by CWBS Feature Code, dated 31Mar13.
- 19. Equipment rates are from the 2011 MII Equipment Library.
- 20. All three sites are within 1.5 miles of each other.
- 21. There are contractors with the necessary equipment located in Saipan.

- 22. There are no manufacturers in the CNMI. All fabricated materials are imported from a variety of places.
- 23. All excess materials will be hauled to the landfill located in Marpi, about 10 miles away.
- 24. The source for the borrow/fill material will come from the sites.
- 25. Material used will be balanced, however, in the event there is excess embankment the material will be hauled to the Marpi landfill to be used as capping material.

#### \*\*\*\* TOTAL PROJECT COST SUMMARY \*\*\*\*

#### \*\*\*\* CONTRACT COST SUMMARY \*\*\*\*

PROJECT: Saipan Lagoon Ecosystem Restoration

DISTRICT: NWW WALLA WALLA

PREPARED: 6/18/2013

POC: CHIEF, COST ENGINEERING, Gary F. Yamauchi

LOCATION: Saipan Lagoon, Sasipan
This Estimate reflects the scope and schedule in report; CAP Feasibility STUDY - ECOSYSTEM RESTORATION REPORT

#### **Abbreviated Risk Analysis**

Project (less than \$40M): Saipan Lagoon Ecosystem Restoration - TSP(C0Q0A1)

Project Development Stage: Feasibility (Recommended Plan)

Risk Category: Moderate Risk: Typical Project or Possible Life Safety

Total Construction Contract Cost = \$ 2,148,130

|    | <u>CWWBS</u>                         | Feature of Work                                                    | <u>C</u> | ontract Cost           | % Contingency    | <u>\$</u> | Contingency              | <u>Total</u> |

|-----------|-----------------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|--------------------|-----|
|           |                                   |                                                         |                                                                                           |                                                                                                                                                                   | Max Pot  | ential Cost Growth | 20% |
| Q-1       | Mobilization -     Demobilization | Level of confidence based on design and assumptions?    | Topo may not be most current thus affecting the grading quantities. Design is conceptual. | The topo is anticipated to be out of date, therefore the grading quantities are likely to change but should only change to have a marginal impact to the project. | Likely   | Marginal           | 2   |
| Q-2       | 2 Chainlink Fence                 | Level of confidence based on design and assumptions?    | Location of properties on topo may not be most current affecting perimeter locations.     | The topo is anticipated to be out of date, therefore the grading quantities are likely to change but should only change to have a marginal impact to the project. | Likely   | Marginal           | 2   |
| Q-3       | 3 Dewatering                      | Level of confidence based on design and assumptions?    | Topo may not be most current thus affecting the grading quantities. Design is conceptual. | The topo is anticipated to be out of date, therefore the grading quantities are likely to change but should only change to have a marginal impact to the project. | Likely   | Negligible         | 1   |
| Q-4       | 4 Road Crossing                   | Level of confidence based on design and assumptions?    |                                                                                           |                                                                                                                                                                   | Unlikely | Negligible         | 0   |
| Q-5       | 5 Grading                         | Level of confidence based on design and assumptions?    | Topo may not be most current thus affecting the grading quantities. Design is conceptual. | The topo is anticipated to be out of date, therefore the grading quantities are likely to change but should only change to have a marginal impact to the project. | Likely   | Significant        | 3   |
| Q-6       | 6 Post-Construction<br>Monitoring | Level of confidence based on design and assumptions?    | As design evolves quantities on current project scope may change due to refinement.       | It is unlikely that there would be any changes after construction.                                                                                                | Unlikely | Marginal           | 0   |
| Q-7       | 7 Drainage                        | Level of confidence based on design and<br>assumptions? | Design is conceptual.                                                                     | With a complete design infrastructure quantities may change slightly.                                                                                             | Likely   | Marginal           | 2   |
| Q-8       | 0                                 | Level of confidence based on design and assumptions?    |                                                                                           |                                                                                                                                                                   | Unlikely | Negligible         | 0   |
| Q-9       | 0                                 | Level of confidence based on design and assumptions?    |                                                                                           |                                                                                                                                                                   | Unlikely | Negligible         | 0   |

Major quantities were provided by the AE and the critical cost items were adjusted to reflect reasonable cost as if this were a bid item. As further details are developed, the major line item costs will be refined which could significantly affect the cost.          | Possible | Significant         |   |
|        | 5 Grading                         | Reliability and number of key quotes? | Assumptions based on concept design. Assumptions were used to establish costs and are relative to contractor markups and assignment, quantities, crews and productivities, quotes and historical cost data. Cost is based on current princing.        | Depending on when the construction takes place, prices could vary greatly and is dependent on the economy. Major quantities were provided by the AE and the critical cost items were adjusted to reflect reasonable cost as if this were a bid item. As further details are developed, the major line item costs will be infined which could significantly affect the cost.          | Possible | Significant         |   |
|        | 6 Post-Construction<br>Monitoring | Reliability and number of key quotes? | Assumptions based on concept design. Assumptions were used to establish costs and are relative to contractor markups and assignment, quantiles, crews and productivities, quotes and historical cost data. Cost is based on current pricing.          | Depending on when the construction takes place, prices could vary greatly and is dependent on the economy. Major quantities were provided by the AE and the critical cost items were adjusted to reflect reasonable cost as if this were a bid item. As further details are developed, the major line item costs will be infined which could significantly affect the cost.          | Possible | Marginal            |   |
|        | 7 Drainage                        | Reliability and number of key quotes? | Assumptions based on concept design. Assumptions were used to establish costs and are relative to contractor markups and assignment, quantiles, crews and productivities, quotes and historical cost data. Cost is based on current princing.         | Depending on when the construction takes place, prices could vary greatly and is dependent on the economy. Major quantities were provided by the AE and the critical cost liters were adjusted to reflect reasonable cost as if this were a bid item. As further details are developed, the major line item costs will be refined which could significantly affect the cost.         | Possible | Significant         |   |

Major quantities were provided by the AE and the critical cost times were adjusted to reflect reasonable cost as if this were a bid item. As further details are developed, the major line item costs will be refined which could significantly affect the cost.  | Possible | Significant         |

Major quantities were provided by the AE and the critical cost times were adjusted to reflect reasonable cost as if this were a bid item. As further details are developed, the major line item costs will be refined which could significantly affect the cost.  | Possible | Significant         |

#### Notes

- 1. The total average annual reduction in runoff for each drinage basin design is the area under the curve. As can be easily seen from the graph, the effect of less frequent (<25-years) storms would be negligable.
- 2. The reduction factor "Y" is calculated as the proportion of average annual runoff reduction for each design level compared with the average annual runoff reduction from the 10-year design.

Appendix K
Post-Construction Monitoring Plan

## APPENDIX K

#### POST-CONSTRUCTION MONITORING PLAN

This monitoring plan is developed with the explicit intent to address the monitoring components and measures of success listed below. The project could be deemed a success if at least five of the following benchmarks were achieved:

- 1. Reduction in the frequency and abundance of nearshore, fast growth nuisance macroalgae (at least a 20 percent [%] reduction in percent cover or 25% reduction in days of occurrence).
- 2. Decrease in the abundance of seasonal macroalgae in the nearshore and mid-lagoon regions (at least a 20% reduction in percent cover).
- 3. Decrease in turbidity of nearshore waters, particularly following storm events (at least a 25% reduction in number of violations of Commonwealth of the Northern Marian Islands [CNMI] Division of Environmental Quality [DEQ] water quality standards for turbidity).
- 4. Decrease in microbial contamination in nearshore waters (at least a 25% reduction in number of violations of DEQ water quality standards for microbial contamination).
- 5. Decrease in nutrient levels in nearshore waters (at least a 25% reduction in number of violations of DEQ water quality standards for nutrients).
- 6. Decrease in contaminant (i.e., turbidity, microbial, and nutrient) concentrations in stormwater exiting the detention basins (at least a 25% reduction in number of violations of DEQ water quality standards for turbidity, microbial contamination, and nutrients).
- 7. Decrease in sediment load entering the Saipan Lagoon at mitigated drainages (at least a 10% reduction in sediment delta area).

Achievement of the first two benchmarks is less certain than the remaining five benchmarks because factors that are not directly linked to the proposed detention basins such as groundwater or other drainages may also affect the outcomes. The last five benchmarks are directly linked to the proposed detention basins and should be achieved by the project.

Site selection recommendations are based on an assumption of prevailing southerly, coast parallel current flows as provided by a three-dimensional current model created by the Secretariat of the Pacific Community (SPC) Applied Geoscience and Technology Division (SOPAC) (Damlamian and Kruger, 2010). Although current reversal is possible, dominant flow patterns suggest that the effects of discharge from restoration activities would be to the south and control sites would appropriately be located north of the mitigated drainage discharge. This plan further assumes that monitoring activities begin prior to construction and continue through five years post-construction. The following protocol provides direction on methods, site selection, frequency of sampling, and the benchmarks addressed by each component.

#### I. PRESENCE AND ABUNDANCE OF NEARSHORE NUISANCE MACROAGLAE

**Methods:** Two primary 'nuisance' algae are found along the shoreline in Saipan Lagoon: hair-like green algae, primarily growing during periods of increased freshwater input into the lagoon, and a wide variety of seasonal macroalgae. Both are addressed here. A permanent sampling area of 3 meters (m) by 50 m should be set up for each sampling series. A 0.5 m by 0.5 m quadrant will be haphazardly tossed inside the sampling area 25 times, moving away from the starting station. A series of tosses will be thrown on the beach and a second series of tosses thrown in the water just adjacent to the shore (Habitat 10). For each toss, the quadrant will be scored for the presence or absence of either the hairlike, green "Enteromorpha-form" algae, other seasonal macroalgae, or both.

**Site Selection:** One site, starting 30 m south of the mitigation drainage and continuing south, and a second control site, starting 30 m north of the mitigation drainage and continuing north.

Frequency of sampling: Weekly

#### Benchmark addressed and Criterion for Success: 1

1. Reduction in the frequency and abundance of nearshore, fast growth nuisance macroalgae (at least a 20% reduction in percent cover or 25% reduction in days of occurrence).

## II. REASSESSMENT OF THE INSHORE LAGOON AREA

**Methods:** This survey provides an evaluation of the dominant benthic cover, including seasonal macroalgae. Each survey site will be made up of five 50 m transects with each transect separated by 3 m gaps. These methods are based on standard protocols used by the CNMI Marine Monitoring Team (MMT) (Starmer and Houk, 2008).

A 0.5 m by 0.5 m quadrant with a six-point grid will be placed at 1 m intervals along the 50 m transects. Surveyors will score benthic substrate under each point. Averages, variances, and statistical power will be calculated based on the 50 m replicates. The benthic categories used for analysis will include corals (to genus level), turf algae (less than 2 centimeters [cm]), macroalgae (greater than 2 cm, genus level if abundant), coralline algae, branching coralline algae, invertebrates with more than 10% benthic coverage (grouped by genus), all other are invertebrates grouped together, and sand/bare substrate.

**Site Selection:** Sites should be located 100 m south (test) and north (control) in the middle portions (heading offshore) of Habitats 12, 14, and 16.

**Frequency of sampling:** Sampling frequency should be two times a year, in June and December. These dates coincide with the times of greatest and least abundance of seasonal macroalgae in the lagoon (Houk and Camacho, 2010).

## Benchmarks addressed and Criteria for Success: 1 and 2

1. Reduction in the frequency and abundance of nearshore, fast growth nuisance macroalgae (at least a 20% reduction in percent cover or 25% reduction in days of occurrence).

2. Decrease in the abundance of seasonal macroalgae in the nearshore and mid-lagoon regions (at least a 20% reduction in percent cover).

#### III. NEARSHORE LAGOON WATER SAMPLING AND RAINFALL DATA

**Methods:** The DEQ has an ongoing United States Environmental Protection Agency (EPA) approved nearshore water quality monitoring program that evaluates basic water quality parameters (salinity, dissolved oxygen [DO], temperature, hydrogen activity [pH], turbidity, and enterococci bacteria) on a weekly basis (Bearden et al., 2012). The DEQ lab is equipped to include orthophosphate and nitrate to this suite of parameters. The recommendation here is to utilize the existing program methodology with the addition of nutrients. Because of the potential of reversed nearshore currents affecting the results, a note regarding prevailing current at the time of sampling should be added.

**Site Selection:** If necessary, add a new test site 30 m southward of the mitigated drainage and use an existing, equivalently distanced DEQ site or create a novel site north of the drainage, as a control. At least one data logging rain gauge should be located in the watershed above and drain into the constructed mitigation measures.

**Frequency of sampling:** Parameters that are part of the current DEQ protocol should be measured weekly. Ideally, nutrients will be included in this, but if they are a novel monitoring parameter, a minimally monthly sampling frequency is recommended. The rain gauge should be set to log hourly rainfall. The data should be downloaded and the gauge maintained at least monthly.

## Benchmarks addressed and Criteria for Success: 3, 4, and 5

- 3. Decrease in turbidity of nearshore waters, particularly following storm events (at least a 25% reduction in number of violations of CNMI water quality criteria for Class AA marine waters for turbidity).
- 4. Decrease in microbial contamination in nearshore waters (at least a 25% reduction in number of violations of CNMI water quality criteria for Class AA marine waters for microbial contamination).
- 5. Decrease in nutrient levels in nearshore waters (at least a 25% reduction in number of violations of CNMI water quality criteria for Class AA marine waters for nutrients).

## IV. STORMWATER SAMPLING

**Methods:** The methods used for nearshore water sampling above may be applied to this monitoring effort and, again, nutrient sampling should be included. In addition, an effort should be made to capture the "first flow" of any given rainfall event and a second sample taken 15 minutes following the first sample. Sampling efforts for rainfall events that do not produce sufficient flow to allow sampling should still be noted.

**Site Selection:** A sampling site should be established at the inflow and at the discharge of each constructed detention basin.

**Frequency of sampling:** Frequency of stormwater sampling will be sporadic and dependent on storm/rainfall events. Given the uncertainty of any given rainfall event producing sufficient flow, effort should be made to capture all storm events possible, with a minimal number of 15 events over the course of the year.

## Benchmark addressed and Criterion for Success: 6

6. Decrease in contaminant (i.e., turbidity, microbial, and nutrient) concentrations in stormwater exiting the detention basins (at least a 25% reduction in number of violations of CNMI water quality criteria for Class AA marine waters for turbidity, microbial contamination, and nutrients).

#### V. RESURVEY OF SEDIMENT DELTAS

**Methods:** The sediment deltas in Saipan Lagoon are formed by sediment build up originating from the drainage watershed. They are the areas where the shoreline deviates away seaward, compared to the prevailing coastline in front of the drainage. A transect line laid parallel to the shoreline along the beach moat and across the delta can be used to define the landward extent of the delta. Once this is done, the seaward extent of the delta can be measured at 1 m intervals to define the outer perimeter of the delta and calculate the delta's area.

**Site Selection:** Drains 4, 6, and 11

Frequency of sampling: Annually

#### Benchmark addressed and Criterion for Success: 7

7. Decrease in sediment load entering the Saipan Lagoon at mitigated drainages (at least a 10% reduction in sediment delta area).

## VI. RISKS AND ADAPTIVE MANAGEMENT

The results from this monitoring plan will be continuously assessed to closely monitor and evaluate the effectiveness of the project. Since the project goal is to restore a diverse natural system in which unpredicted events may occur during the course of the monitoring period or unknown/unpredicted factors may influence the outcome of the project, it is prudent to allow for adaptive management to be implemented if it becomes necessary. For example, if a large storm event takes place during construction of the project, it may be necessary to reevaluate the baseline conditions or to adjust the monitoring parameters and benchmark goals. If, in the event the project benchmarks are not reached at the end of the monitoring period, extensive post-construction may be warranted. New knowledge, inventories, research, and technologies, as it becomes available, will be considered during the process of adaptive management to best manage and evaluate the outcome of the project.

## STATEMENT OF TECHNICAL REVIEW

## COMPLETION OF DISTRICT QUALITY CONTROL/QUALITY ASSURANCE

The District has completed the Saipan Lagoon Aquatic Ecosystem Restoration Study, Island of Saipan, Commonwealth of the Northern Mariana Islands. Notice is hereby given that District Quality Control/Quality Assurance (DQC) has been conducted. During the DQC, compliance with established policy principles and procedures, utilizing justified and valid assumptions, was verified. This included review of: assumptions, methods, procedures, and material used in analyses, alternatives evaluated, the appropriateness of data used and level obtained, and reasonableness of the result, including whether the product meets the customer's needs consistent with law and existing Corps policy. All comments resulting from DQC have been resolved.

Nakamura                | Place cumulative impacts after indirect impacts                                                                                                                                                                                                                | Concur. Will include discussion on "Cumulative Impacts" after "Indirect Impacts".                                                                                                                                                                                                                                                                                                                            | Closed           |
| Env-9 (EA)               | 27             | 36                             | D. Nakamura                | Mention erosion control BMPs as mitigation                                                                                                                                                                                                                     | Concur. BMP relating to soil erosion controls will be added to section 3.1.2.                                                                                                                                                                                                                                                                                                                                | Closed           |
| Env-10 (EA)              | 38             | 4                              | D. Nakamura                | Under FWCA, the proponent is to give natural resources equal consideration not strong consideration to the views of FWS, etc.                                                                                                                                  | Concur. Section 3.7-Biological Resources will be revised to include clearer definition of FWCA, and will be moved to section 4.6 Fish and Wildlife Coordination Act                                                                                                                                                                                                                                          | Closed           |
| Env-11 (EA)              | 39             | 28                             | D. Nakamura                | Section 7 doesn't call for evaluation of impacts but consultation to determine effects of an action on T&E species and critical habitats.                                                                                                                      | Concur. Discussion of Section 7 ESA will be revised to include the comment, and will be moved to section 4.5 Endangered Species Act.                                                                                                                                                                                                                                                                         | Closed           |
| Env-12 (EA)              | 41             | 18                             | D. Nakamura                | Section 106 consultation also involves cultural and archaeological resources not just historic properties                                                                                                                                                      | include the comment, and will be moved to section 4.11 Section 106 NHPA.                                                                                                                                                                                                                                                                                                                                     | Closed           |
| Env-13 (ERR)             | 49             | 32                             | D. Nakamura                | If the restoration outcomes are dependent upon implementation of LUCs/BMPs by the local sponsor, then how are restoration outcomes attributed to the project alone. If this is not the case, then suggest changing "also depend on" to "will be augmented by". | success of the detention basins also depends on local implementation of land use controls and other BMPs for contaminant reduction in the West Takpochao watershed." has been revised to read:  "It is also important to note that success of the detention basins will be augmented by local implementation of land use controls and other BMPs for contaminant reduction in the West Takpochao watershed." | Closed           |

| Env-14 (ERR) | 50/51       |                 | D. Nakamura  | For, the LGHU calculation, please explain why identification of PCAs in Appendix B.5 included nutrient and sediment PCAs but the calculation of nutrient runoff is not considered and the sediment portion of the calculation is based on a Google Earth approximation and not on the identified sediment PCAs. This should be explained here. | sedimentation PCAs. Becuase of the limited number of nutrient PCAs identified, they were not included in the LGHU calculation considering that they would have a negligent effect on the outcome. The sediment portion of the LGHU calculation was based on Google Earth to include unvegetated/bare land in the upper watershed within the study area that were not necessarily counted as PCAs, considering that these areas would contribute a majority of sediments that is washed into the lagoon. The following explanation has been added in Page 57, line 25: "In addition to the runoff and hazardous waste PCAs, the PCA inventory identified several sedimentation and nutrient PCAs within the study area (Appendix B.5). Because of the limited number of nutrient PCAs that were identified within the study area, the calculation of nutrient runoff was not considered in the LGHU calculation. The small number of nutrient PCAs was considered to have a negligent impact on the outcome. The sedimentation factor calculation was based on Google Earth and not on the number of sedimentation PCAs to include unvegetated/bare land in the upper watershed within the study area that were not identified during the PCA inventory. This method was considered to result in a more accurate estimate of sedimentation that occurs within the study area." | Closed |
